The State of Psychiatry (Psychology Revivals)

Dec 13 2020 To mark his retirement in 1966 from the Professorship of Psychiatry at the University of London, and the directorship of the Institute of Psychiatry, the Maudsley Hospital, Professor Lewis's students edited and prepared an edition of his collected papers, in two volumes. Originally published in 1967 this volume reviews the psychiatric past, surveys the transitional stage psychiatry had reached, and looks forward to the attainable future. The author pays much attention to disputed areas of psychiatric practice and inquiry, how psychiatrists should be chosen and educated, what concepts and methods are required for the furtherance of the subject, what part should social treatment and psychological treatment play. Today it can be read and enjoyed in its historical context.

Drug Testing in Alternate Biological Specimens
Feb 01 2020 Although the specimen of choice in the US drug testing industry is urine, and serum in clinical medicine, interest has recently grown in the use of other matrices as drug testing media. This book provides researchers and forensic toxicologists with a convenient general text summarizing the state of knowledge today. Chapters focus specifically on the application of these practices to drugs of abuse. The up-to-date information provided is complemented with thorough references.

The Human Blood Basophil Nov 23 2021 The blood basophils lead a shadowy existence in the field of hematology, even now, 100 years after their discovery by PAUL EHRLICH. In clinical

medicine they were hardly noticed for many decades, since they occur in such small numbers in the blood that small and moderate variations in the basophil count were not detectable with common counting methods. This situation has changed since the introduction of direct counting methods. It was noticed, for example, that the blood basophil count is increased in hyperlipemia. In the field of pathology the blood basophil was practically overlooked until recently. This was due to the fact that with common fixations in aqueous solutions the granules dissolve, so that the cells can no longer be stained specifically and therefore escape observation. This problem was solved through special fixing solutions. However, interest in the blood basophils remained confined to only a few research groups. *Anzeiger Der Kaiserlichen Akademie Der Wissenschaften, Mathematisch-Naturwissenschaftliche Classe* May 30 2022 Drugs, Driving and Traffic Safety Jul 08 2020 *Drugs, Driving and Traffic Safety* gives a comprehensive overview of the effects of different medical conditions like neurological disorders, anxiety and depression and their pharmaceutical treatment on driving ability. In addition, the effects of alcohol and drugs of abuse are discussed. Leading experts present the different methodologies to examine effects of drugs on driving, and summarize the recent scientific evidence including epidemiological studies, roadside surveys, laboratory tests, driving simulators, and the standardized driving test. The volume includes guidelines of the International Council on Alcohol, Drugs and Traffic Safety (ICADTS) and the ICADTS Drugs List 2007. *Drugs, Driving and Traffic Safety* is written for physicians, psychiatrists and pharmacists who want to inform their patients who use psychoactive drugs.

Therapy of Feto-Placental Insufficiency Mar 16 2021 The progress in biological sciences and its applications in obstetrics in the last twenty years have formed the base for feto-placental semeiotics. In this way, it has been possible to diagnose placental insufficiency even in patients whose clinical conditions gave all the indications of a perfectly normal feto-placental condition. On the other hand, observations have

shown that in certain conditions some deficiencies can improve until normality is reached again. On the basis of the above one feels justified to talk about the therapy of feto-placental insufficiency. Until now this therapy has been aimed at the obstetrical pathology of the mother. Our aim is to illustrate the various steps which should be taken to execute an efficient therapy of the conditions relating to the pathology of the fetus, realizing full well that fetal pharmacology is only now being taken into consideration. The various steps to be taken, the length of therapy, and all the other correlated factors are still the object of individual experiences, and we are fortunate to have amongst us researchers in this field who have accepted our invitation and can supply us with their personal experiences which can also be compared. The first international symposium on the therapy of feto-placental insufficiency has been organized in conjunction with the Samil-Pabyrn Foundation whom I would like to thank, and especially so its president, Mrs. INGE SAXON-MILLS.

The Spiritual Dimension of Alternative Medicine Dec 01 2019 We often hear that alternative medicine is superior to classical medicine, for it treats us holistically, both the physical body and the immaterial part of our nature. Although such an approach seems desirable, it is precisely this aspect that opens the door to spiritual views incompatible with Christianity. Many forms of alternative medicine speak of a divine essence we allegedly possess, of a vital force that we can manipulate, of spiritual beings that can help us, and other such views closely related to Eastern religions and New Age thought. In their desire to find healing at any price, Christians often resort to these methods without realizing the spiritual danger involved. For Christians who want to live consistently with their faith, this book is intended to raise awareness of the hidden beliefs of alternative medicine.

Dark Medicine Dec 25 2021 This collection of essays looks at the dark medical research conducted during and after World War II. Contributors describe this research, how it was brought to light, and the rationalisations of those who perpetrated and benefited from it.

Medicine Across Cultures Jan 14 2021 This work deals with the medical knowledge and beliefs of cultures outside of the United States and Europe. In addition to articles surveying Islamic, Chinese, Native American, Aboriginal Australian, Indian, Egyptian, and Tibetan medicine, the book includes essays on comparing Chinese and western medicine and religion and medicine. Each essay is well illustrated and contains an extensive bibliography.

Doubting sex Jul 20 2021 An adolescent girl is mocked when she takes a bath with her peers, because her genitals look like those of a boy. A couple visits a doctor asking to 'create more space' in the woman for intercourse. A doctor finds testicular tissue in a woman with appendicitis, and decides to keep his findings quiet. These are just a few of the three hundred European case histories of people whose sex was doubted during the long nineteenth century that Geertje Mak draws upon in her remarkable new book. How did people deal with such situations? How did they decide to which sex a person should belong? This groundbreaking analysis of clinical case histories shows how sex changed from an outward appearance inscribed in a social body to something to be found deep inside body and self. A fascinating, easy to follow, yet sophisticated argument addressing major issues of the history of body, sex, and self, this volume will fit advanced undergraduate courses, while challenging specialists.

Ethics for Graduate Researchers May 06 2020

This edited collection is intended as a primer for core concepts and principles in research ethics and as an in-depth exploration of the contextualization of these principles in practice across key disciplines. The material is nested so that readers can engage with it at different levels and depths. It is unique in that it combines an analysis of complex ethical debates about the nature of research and its governance with the best of case-based and discipline-specific approaches. It deals with the following topics in depth: in the natural sciences, it explores the scientific integrity of the researcher and the research process, human cloning as a test case for the limits to research, and the emerging ethical issues in nanotechnology; in the health sciences, it takes up the question of consent, assent and proxies, research with vulnerable groups and the ethics of clinical trials; in the social sciences, it explores the issues that arise in qualitative research, interviews and ethnography; and in the humanities, it examines contested archaeologies and research in divided societies. Thin layer chromatographic-, high pressure liquid chromatographic- and gas chromatographic-fingerprint analytical techniques allow the detection of all main low-molecular constituents of a plant drug and even single constituents can be visualized. Analytical results thereof are shown in numerous color figures. The quality proof of the investigation meets the standard of the European Drug Regulatory Authority. Furthermore, this volume gives a detailed description of the analytical methods used for several drugs. Bioactive constituents, pharmacological and biological activities of several single herbal drugs as well as their therapeutic applications are discussed.

Laboratory Diagnostic Pathways Jul 28 2019 The prognosis of a disease often depends on the timing of therapeutic intervention, which in turn strongly relies on a reliable and quick diagnosis. Laboratory diagnostic pathways are algorithms that give structure to the diagnostic process, thereby minimizing the risk of mistreatment, shortening the hospital stay, and lowering the cost for treatment. This book offers 70 diagnostic algorithms that lead physicians and laboratory personnel through the diagnostic process in a step-by-step fashion.

In Part One, general basics, infrastructure, and economic aspects are discussed and tips for implementation are given. Part Two introduces screening methods for cases without a suspected diagnosis as well as specific pathways for stepwise diagnosis of the most common diseases, accompanied by information on pathophysiology, preanalytical measures, implementation, and interpretation of results. *Medicinis-chirurgische Rundschau* Oct 23 2021

Literature, Neurology, and Neuroscience: Historical and Literary Connections Aug 28 2019

This well-established international series examines major areas of basic and clinical research within neuroscience, as well as emerging and promising subfields. This volume on the neurosciences, neurology, and literature vividly shows how science and the humanities can come together --- and have come together in the past. Its sections provide a new, broad look at these interactions, which have received surprisingly little attention in the past. Experts in the field cover literature as a window to neurological and scientific zeitgeists, theories of brain and mind in literature, famous authors and their suspected neurological disorders, and how neurological disorders and treatments have been described in literature. In addition, a

myriad of other topics are covered, including some on famous authors whose important connections to the neurosciences have been overlooked (e.g., Roget, of Thesaurus fame), famous neuroscientists who should also be associated with literature, and some overlooked scientific and medical men who helped others produce great literary works (e.g., Bram Stoker's Dracula). There has not been a volume with this coverage in the past, and the connections it provides should prove fascinating to individuals in science, medicine, history, literature, and various other disciplines. This book looks at literature, medicine, and the brain sciences both historically and in the light of the newest scholarly discoveries and insights

Famous Composers - Diseases Reloaded Jun 06 2020 The life and death, but also the creative work of famous musicians is closely linked to their personal medical histories. In "Famous Composers - Diseases Reloaded" these case histories are vividly reconstructed on the basis of authentic biographical testimonies and closely linked to the personalities of the musicians. The latest research findings on the pathophysiology of these composers will be woven into the overall picture. Was Paganini's "devilishness" caused by a hereditary disease? Did Scarlatti have strange signs of illness on his fingers? What did Bach really die of? How did "Christel" from a dubious milieu change Schumann's entire life? What aggravated Ravel's underlying illness so that he did not complete a single composition in the last five years before his death? How did Tárrega manage to play the guitar again after his stroke with hemiplegia? Did the Brazilian Villa-Lobos' worldwide reputation help him live longer thanks to the best treatment available to him? Andreas Otte, physician and musician, has incorporated the latest medical history research into the composers' pathographies. This book is an exciting and "well-tempered" reading experience not only for physicians, music lovers, musicologists and musicians, but for all readers who want to develop a basic

understanding of the pathophysiology and life scores of these great masters under current conditions from today's perspective.

Forschungsfreiheit und Forschungskontrolle in der Medizin / Freedom and Control of Biomedical Research Oct 11 2020 Die Deklaration von Helsinki des Weltärztebundes gilt als wichtigstes Dokument ärztlicher Standesauffassung zur medizinischen Forschung am Menschen. Ihr Einfluß auf die ärztliche Ethik und auf nationale Regelungen zur biomedizinischen Forschung ist unbestritten. Seit einiger Zeit wird innerhalb des Weltärztebundes über eine Änderung der Deklaration von Helsinki beraten, die zu einer grundlegenden Umgestaltung der Deklaration und zur Aufhebung wichtiger Prinzipien führen könnte. Dies war Anlaß eines internationalen Symposiums in Göttingen vom 7. bis zum 11. April. Der vorliegende Band enthält die für das Symposium erstellten Landesberichte und Generalberichte aus 14 europäischen und außereuropäischen Ländern sowie die Zusammenfassung der Beratungsergebnisse,

die als "Göttinger Papier" erfolgreich in die laufenden Beratungen des Weltärztebundes eingebracht wurden.

Carbon Fibers Filaments and Composites

Apr 04 2020 Conventional synthetic materials, like metals, ceramics or glass, are usually isotropic substances, and their suitability for structural applications is achieved by morphological design and combination in the macroscopic scale. However, in modern engineering this is often not acceptable. As an alternative, the use of non-homogeneous, anisotropic materials, with significant stiffness and strength only in the directions these mechanical properties are really needed, can lead to enormous material (and weight) savings. This is the case of multiphase systems called composite materials. In these composites, different material parts are added and arranged geometrically, under clearly designed and controlled conditions. Usually, a structure of fibers provides strength and stiffness and a matrix holds them together, whilst providing the geometric form. Carbon fibers are among the high-performance fibers employed in these advanced structural composites, which are profoundly changing many of today's high technology industries. New research and development challenges in this area include upgrading the manufacturing process of fibers and composites, in order to improve characteristics and reduce costs, and modifying the interfacial properties between fibers and matrix, to guarantee better mechanical properties. The interdisciplinary nature of this "new frontier" is obvious, involving chemistry, materials science, chemical and mechanical engineering. Other topics, which more often are treated separately, are also important for the understanding of the processes of fiber production. Carbon filaments is one such topic, as the study of their mechanisms of nucleation and growth is clearly quite relevant to the production of vapour-grown carbon fibers.
